The cytochrome c heme

copper-containing nitric oxide reductase of the soil bacterium *Azotobacter vinelandii* has been isolated as an apoprotein in high yield. The UV-visible spectrum and the heme composition indicate that a mixture of two hemes, one iron, two copper and one cysteine, are present in the

protein. The crystal structure of the cytochrome c domain has been determined at a resolution of 1.8 Å by X-ray diffraction. The native protein crystallized in the tetragonal space group  $P4(3)2(1)2$ , with cell parameters  $a = b = 64.1$  Å,  $c = 146.5$  Å, and two molecules per

asymmetric unit. The structure has been refined to a final R value of 0.19 for data in the range 2.5-7 Å. A model consisting of 196 atoms, the heme, 59 water molecules and two chloride ions, was built. The asymmetric unit contains two Cys residues, each of which is linked to the heme via

## What's New In?

More options for data management. Exporting to PDF is now built in. Designers can also import an image into a drawing and save it to a local disk, as a new RTF export, or save it as a printable format such as a PNG. (video: 2:38 min.)

Export to PDF and  
Project Files: Save your

---

drawing as a PDF file directly from within the application. Or, you can export a PDF file, work, and then re-import the updated drawing back into the application.

(video: 2:11 min.) Project files (XML files) are now saved in the project folder, no longer in the project file drawer.

(video: 2:10 min.) Export

automatically without losing link to shared

files. Connect to a

network drive and create shared folders that you

---

can access from your drawing. (video: 1:52 min.)

Perspective and Chapter: You can save the current perspective as a separate view. Now you can customize your view with a perspective, showing only the view you want. (video: 1:50 min.)
